

**PRESS RELEASE**  
18 December 2012

## Artemis™ Raman Microspectrophotometer

Recently Artemis™, the new state-of-the-art in Raman Microspectrophotometry, was released by **CRAIC Technologies** and is now available from **Warsash Scientific**. Designed to be added to many different types of optical microscopes, Artemis offers very high sensitivity, high resolution, a broad spectral range and rapid sampling times. It enables scientists and engineers to measure the Raman spectra from microscopic samples or microscope sampling areas of large samples, such as semiconductors.

Artemis can be added to a CRAIC microspectrophotometer to add Raman to UV-visible-NIR absorbance, reflectance and fluorescence microspectroscopy and imaging. The cutting edge technology of the CRAIC Helios™ means that a whole host of capabilities are now available to researchers and engineers. The introduction of the Artemis Raman spectrometer offers you an even more powerful tool for sample micro-analysis.

Artemis is a self-contained unit that features the latest in long-lived laser technology, an advanced optical interface to the microscope, a truly unique Raman spectrometer and advanced software for instrument control and data analysis. Different units are designed for use with different wavelength lasers and all offer extremely high sensitivity, high resolution, a broad spectral range and fast scan times. These rugged, self-contained units are designed to be used either with an optical microscope or with a CRAIC microspectrophotometer.

### KEY FEATURES:

- Raman microspectrophotometer
- Can be added to many types of optical microscopes
- Can be added to a CRAIC microspectrophotometer
- Self-contained
- Rapid sampling times
- High Sensitivity
- High Spectral Resolution
- Broad Spectral Range
- Durable Design
- Easy to Use
